#### WINTER - 2022 EXAMINATION

<u>Subject Name:</u> Java Programming <u>Model Answer</u> <u>Subject Code:</u> 22412

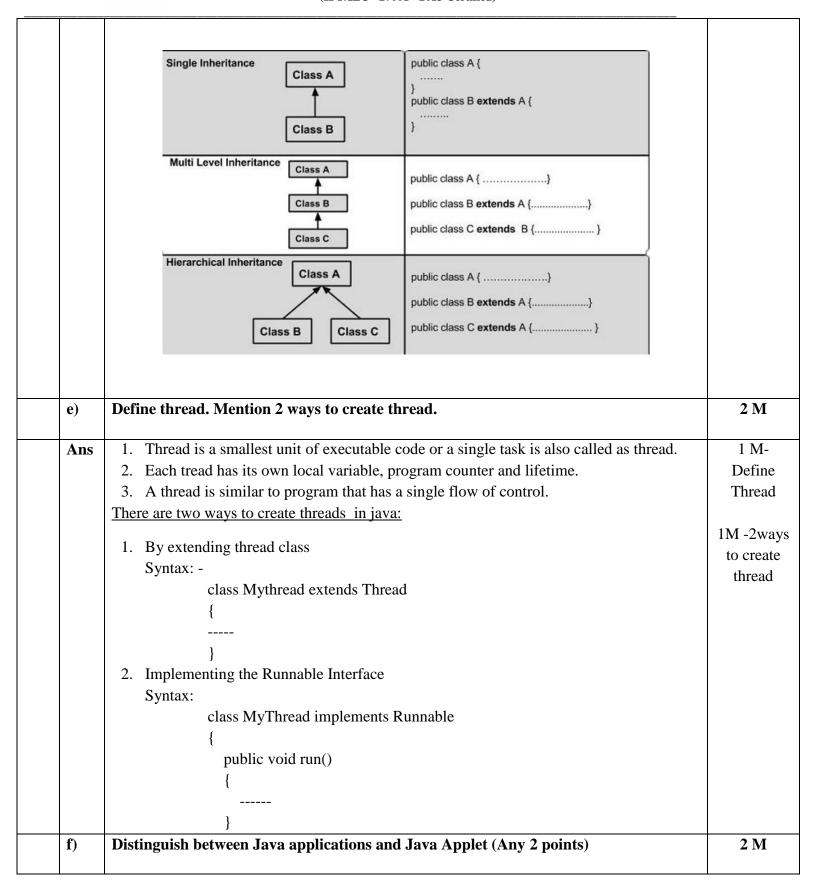

### **Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English +Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

Q. No.	Sub Q. N.	Answer			
1		Attempt any <u>FIVE</u> of the following:		10 M	
	a)	State any four relational operators a	and their use.	2 M	
	Ans	Operator	Meaning	2M (1/2 M each)	
		<	Less than	Any Four	
		>	Greater than		
		<=	Less than or equal to		
		>=	Greater than or equal to		
		==	Equal to		
		!=	Not equal to		
	<b>b</b> )	Enlist access specifiers in Java.		2 M	
	Ans	The access specifiers in java sp	pecify accessibility (scope) of a data member,	2M (1/2 M	
		method, constructor orclass. There	are 5 types of java access specifier:	each)	
		• public		Any Four	
		<ul><li>private</li></ul>			

	default (Friendly)	
	• protected	
	private protected	
c)	Explain constructor with suitable example.	2 M
Ans	Constructors are used to assign initial value to instance variable of the class.	1M-
	It has the same name as class name in which it resides and it is syntactically similar	Explanati
	to anymethod.	1M-
	Constructors do not have return value, not even 'void' because they return the instance if class.	Examp
	Constructor called by new operator.	
	Example:	
	class Rect	
	{	
	int length, breadth;	
	Rect() //constructor	
	{	
	length=4; breadth=5;	
	}	
	public static void main(String args[])	
	{	
	Rect $r = new Rect();$	
	System.out.println("Area:"+(r.length*r.breadth));	
	}	
	}	
	Output : Area : 20	
d)	List the types of inheritance which is supported by java.	2 M
Ans		Any tw
		1 M ea
		1 W Ca

Ans			1 M for each point
			(any 2
	Applet	Application	Points)
	Applet does not use main()	Application use main() method	
	method for initiating execution of code	for initiating execution of code	
	Applet cannot run independently	Application can run independently	
	Applet cannot read from or write	Application can read from or	
	to files in local computer  Applet cannot communicate with	write to files in local computer  Application can communicate	
	other servers on network	with other servers on network	
	Applet cannot run any program from local computer.	Application can run any program from local computer.	
	Applet are restricted from using libraries from other language	Application are not restricted	
	such as C or C++	from using libraries from other language	
	Applets are event driven.	Applications are control driven.	
<b>g</b> )	Draw the hierarchy of stream classes.		2 M
Ans			23.5.6
71113			2M-Correct diagram
	InputStream F	eArrayInputStream  BufferedInputStream  ilterInputStream  DataInputStream  bjectInputStream	
	Object OutputStream Fi	eArrayInputStream  BufferedInputStream  DataInputStream	
	Object OutputStream Fi	BufferedInputStream  DataInputStream  bjectInputStream  blieOutputStream  DataOutputStream  DataOutputStream  BufferedOutputStream	

2.		Attempt any <u>THREE</u> of the following:	12 M
	a)	Write a program to check whether the given number is prime or not.	4 M
	Ans	Code:	4M (for any
		class PrimeExample	correct program
		{	and logic)
		<pre>public static void main(String args[]){</pre>	
		int i,m=0,flag=0;	
		int n=7;//it is the number to be checked	
		m=n/2;	
		$if(n==0  n==1){$	
		System.out.println(n+" is not prime number");	
		}else{	
		for(i=2;i<=m;i++){	
		$if(n\%i==0){$	
		System.out.println(n+" is not prime number");	
		flag=1;	
		break;	
		}	
		}	
		if(flag==0) { System.out.println(n+" is prime number"); }	
		}//end of else	
		}	
		}	
		Output:	
		7 is prime number	

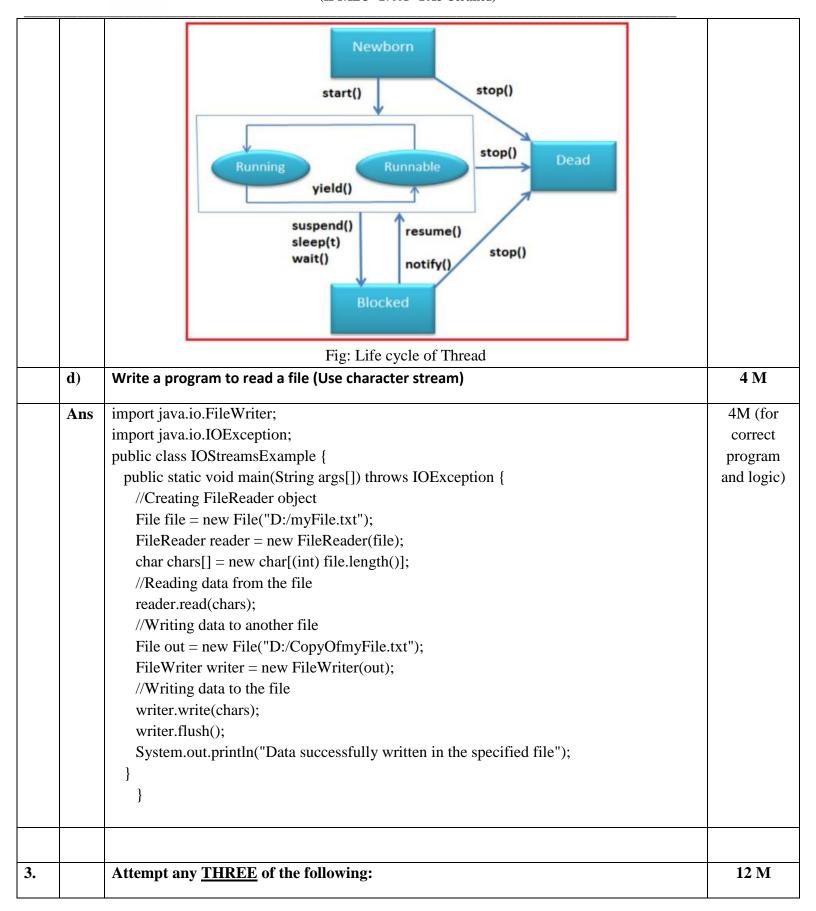

b	<b>b</b> )	Define a class employee with data members 'empid , name and salary.	4 M
		Accept data for three objects and display it	
A	Ans	class employee	4M (for
		<b>{</b>	correct
		int empid;	program
		String name;	and logic)
		double salary;	_
		void getdata()	
		{	
		BufferedReader obj = new BufferedReader (new InputStreamReader(System.in));	
		System.out.print("Enter Emp number : ");	
		empid=Integer.parseInt(obj.readLine());	
		System.out.print("Enter Emp Name : ");	
		name=obj.readLine();	
		System.out.print("Enter Emp Salary : ");	
		salary=Double.parseDouble(obj.readLine());	
		}	
		void show()	
		{	
		System.out.println("Emp ID: " + empid);	
		System.out.println("Name: " + name);	
		System.out.println("Salary: " + salary);	
		}	
		) }	
		classEmpDetails	
		{	
		public static void main(String args[])	
		public static void main(string args[])	
		employee e[] = new employee[3];	
		for(inti=0; i<3; i++)	
		IOI(IIII-0, I\3, I++)	
		t   e[i] = new employee(); e[i].getdata();	
		l c[1] = new employee(), c[1].gettatta(),	
		System.out.println(" Employee Details are : ");	
		for(inti=0; i<3; i++)	
		e[i].show();	
		j	

(c)	D	escri	be Life cycle of thread with suitable diagram.	4 M
A	ns	1)	Newborn State  A NEW Thread (or a Born Thread) is a thread that's been created but not yet started. It remains in this state until we start it using the start() method.  The following code snippet shows a newly created thread that's in the NEW state:  Runnable runnable = new NewState();  Thread t = new Thread(runnable);	1M-digram of life cycle 3M- explanation
		3)	Runnable State  It means that thread is ready for execution and is waiting for the availability of the processor i.e. the thread has joined the queue and is waiting for execution. If all threads have equal priority, then they are given time slots for execution in round robin fashion. The thread that relinquishes control joins the queue at the end and again waits for its turn. A thread can relinquish the control to another before its turn comes by yield().  Runnable runnable = new NewState();  Thread t = new Thread(runnable); t.start();  Running State  It means that the processor has given its time to the thread for execution. The thread runs until it relinquishes control on its own or it is pre-empted by a higher priority thread.  Blocked State  A thread can be temporarily suspended or blocked from entering into the runnable and running state by using either of the following thread method.  o suspend(): Thread can be suspended by this method. It can be rescheduled by resume().	
		5)	<ul> <li>wait(): If a thread requires to wait until some event occurs, it can be done using wait method and can be scheduled to run again by notify().</li> <li>sleep(): We can put a thread to sleep for a specified time period using sleep(time) where time is in ms. It reenters the runnable state as soon as period has elapsed /over.</li> <li>Dead State</li> <li>Whenever we want to stop a thread form running further we can call its stop(). The stop() causes the thread to move to a dead state. A thread will also move to dead state automatically when it reaches to end of the method. The stop method may be used when the premature death is required</li> </ul>	

Page No: 7 | 24

a)	Write a program to find reverse of a number.	4 M
Ans	public class ReverseNumberExample1	Any
	{ public static void main(String[] args)	Correct program
	{	with proper
	int number = 987654, reverse =0;	logic -4M
	while(number !=0)	
	<b>1</b>	
	int remainder - number 0/ 10:	
	int remainder = number % 10;	
	reverse = reverse * 10 + remainder;	
	number = number/10;	
	}	
	System.out.printtln("The reverse of the given number is: " + reverse);	
	} }	
<b>b</b> )	State the use of final keyword with respect to inheritance.	4 M
Ans	Final keyword: The keyword final has three uses. First, it can be used to create the equivalent of a named constant. (in interface or class we use final as shared constant or constant.)	Use of final keyword-2 M
	Other two uses of final apply to inheritance	Program-2 M
	Using final to Prevent Overriding While method overriding is one of Java's most powerful features,	IVI
	To disallow a method from being overridden, specify final as a modifier at the start of its declaration. Methods declared as final cannot be overridden.	
	The following fragment illustrates final:	
	class A	
	{	
	final void meth()	
	{	
	System.out.println("This is a final method.");	

	}	
	}	
	class B extends A	
	{	
	void meth()	
	{ // ERROR! Can't override.	
	System.out.println("Illegal!");	
	}	
	}	
	As base class declared method as a final, derived class can not override the definition of base class methods.	
c)	Give the usage of following methods	4 M
	i) drawPolygon () ii) DrawOval () iii) drawLine () iv) drawArc ()	
Ans	i) drawPolygon ():	Method use
	<ul> <li>drawPolygon() method is used to draw arbitrarily shaped figures.</li> <li>Syntax: void drawPolygon(int x[], int y[], int numPoints)</li> <li>The polygon"s end points are specified by the co-ordinates pairs contained within the x and y arrays. The number of points define by x and y is specified by numPoints.</li> <li>Example: int xpoints[]={30,200,30,200,30};</li></ul>	with description 1 M
	To draw an Ellipses or circles used drawOval() method can be used.	
	<ul> <li>Syntax: void drawOval(int top, int left, int width, int height) The ellipse is drawn within a bounding rectangle whose upper-left corner is specified by top and left and whose width and height are specified by width and height to draw a circle or filled circle, specify the same width and height the following program draws several ellipses and circle.</li> <li>Example: g.drawOval(10,10,50,50);</li> </ul>	
	ii) drawLine ():	
	• The drawLine() method is used to draw line which take two pair of coordinates,	

			as arguments and draws a line between them.			
			g is passed to paint() method.			
		• Syntax: g.drawLine(x				
		Example: g.drawLine	e(100,100,300,300;)			
		iv) drawArc ()				
		drawArc() It is used to dra	aw arc.			
		Syntax: void drawArc(int x, i	nt y, int w, int h, int start_angle, int sweep_angle);			
		where x, y starting point, w & h are width and height of arc, and start_angle is start				
		angle of arc sweep_angle is do	egree around the arc			
		Example: g.drawArc(10, 10, 3	30, 40, 40, 90);			
	<b>d</b> )	Write any four methods of f	ile class with their use.	4 M		
	Ans			One		
		public String getName()	Returns the name of the file or directory denoted by this abstract pathname.	method		
		public String getParent()	Returns the pathname string of this abstract pathname's	1 M		
			parent, or null if this pathname does not name a parent directory			
		public String getPath()	Converts this abstract pathname into a pathname string.			
		public boolean isAbsolute()	Tests whether this abstract pathname is absolute. Returns			
			true if this abstract pathname is absolute, false otherwise			
		public boolean exists()	Tests whether the file or directory denoted by this abstract			
			pathname exists. Returns true if and only if the file or			
			directory denoted by this abstract pathname exists; false			
			otherwise			
		public boolean isDirectory()	Tests whether the file denoted by this abstract pathname is			
			a directory. Returns true if and only if the file denoted by			
			this abstract pathname exists and is a directory; false			
			otherwise.			
		public boolean isFile()	Tests whether the file denoted by this abstract pathname is			
			a normal file. A file is normal if it is not a directory and, in			
			addition, satisfies other system-dependent criteria. Any			
			nondirectory file created by a Java application is guaranteed			
			to be a normal file. Returns true if and only if the file			
			denoted by this abstract pathname exists and is a normal			
			file; false otherwise.			
4.		Attempt any THREE of the	following:	12 M		
	<b>a</b> )	Write all primitive data type	es available in Java with their storage Sizes in	4 M		
	a, primare data types aranasie in sura trial men secrete sines in

	bytes.		
Ans			Data typ
	Data Type	Size	name, siz
	Byte	1 Byte	and defau
	Short	2 Byte	value and
	Int	4 Byte	description
	Long	8 Byte	carries 1
	Double	8 Byte	
	Float	4 Byte	
	Char	2 Byte	
	boolean	1 Bit	
<b>b</b> )	Write a program to add 2 integer, 2 stri Remove the element specified by the user an	_	4 M
Ans	import java.io.*;		Correct
	import java.lang.*;		program-
	import java.util.*;		M, stepw
	class vector2		can give
	{		marks
	public static void main(String args[])		
	{		
	vector v=new vector();		
	Integer s1=new Integer(1);		
	Integer s2=new Integer(2);		
	String s3=new String("fy");		
	String s4=new String("sy");		
	Float s? new Float(1.1f);		
	Float s8=new Float(1.2f);		
	v.addElement(s1);		
	v.addElement(s2);		
	v.addElement(s3);		
	v.addElement(s4);		
	v.addElement(s7);		
	v.addElement(s8);		
	System.out.println(v);		
	v.removeElement(s2);		
	v.removeElementAt(4);		
	System.out.println(v);		
	}		
	}		
<b>c</b> )	Develop a program to create a class 'Book'	having data members author, title	4 M

	method to initialize and display the information for three objects.	
Ans	class Book	Correct
	{	program- 4
	String author, title, publisher;	M
	Book(String a, String t, String p)	
	{	
	author = $a$ ;	
	title = t;	
	publisher = p;	
	}	
	}	
	class BookInfo extends Book	
	{	
	float price;	
	int stock_position;	
	BookInfo(String a, String t, String p, float amt, int s)	
	{	
	super(a, t, p);	
	price = amt;	
	stock_position = s;	
	}	
	void show()	
	{	
	System.out.println("Book Details:");	
	System.out.println("Title: " + title);	
	System.out.println("Author: " + author);	
	System.out.println("Publisher: " + publisher);	
	System.out.println("Price: " + price);	
	System.out.println("Stock Available: " + stock_position);	
	}	
	}	
	class Exp6_1	
	{	
	public static void main(String[] args)	
	{	
	BookInfo ob1 = new BookInfo("Herbert Schildt", "Complete Reference", "ABC	
	Publication", 359.50F,10);	
	BookInfo ob2 = new BookInfo("Ulman", "system programming", "XYZ Publication",	
	359.50F, 20);	
	BookInfo ob3 = new BookInfo("Pressman", "Software Engg", "Pearson Publication",	
	879.50F, 15);	
	ob1.show();	

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

	ob2.show();	
	ob3.show();	
	}	
	}	
	OUTPUT	
	Book Details:	
	Title: Complete Reference	
	Author: Herbert Schildt	
	Publisher: ABC Publication	
	Price: 2359.5	
	Stock Available: 10	
	Book Details:

<b>d</b> )	Mention the steps to add applet to HTML file. Give sample code.	4 M
Ans	Adding Applet to the HTML file:	Steps – 2M
	Steps to add an applet in HTML document	Example –
	1. Insert an <applet> tag at an appropriate place in the web page i.e. in the body section</applet>	2 M
	of HTML	
	file.	
	2. Specify the name of the applet's .class file.	
	3. If the .class file is not in the current directory then use the codebase parameter to	
	specify:-	
	a. the relative path if file is on the local system, or	
	b. the uniform resource locator(URL) of the directory containing the file if it is on a remote	
	computer.	
	4. Specify the space required for display of the applet in terms of width and height in	
	pixels.	
	pixels.	
	pixels. 5. Add any user-defined parameters using <param/> tags	

Page No: 14 | 24

```
"Hellojava.java"
import java.awt.*;
import java.applet.*;
public class Hellojava extends Applet
public void paint (Graphics g)
g.drawString("Hello Java",10,100);
} }
Use the java compiler to compile the applet "Hellojava.java" file.
C:\jdk> javac Hellojava.java
After compilation "Hellojava.class" file will be created. Executable applet is nothing but
the .class file
of the applet, which is obtained by compiling the source code of the applet. If any error
message is
received, then check the errors, correct them and compile the applet again.
We must have the following files in our current directory.
o Hellojava.java
o Hellojava.class
o HelloJava.html
If we use a java enabled web browser, we will be able to see the entire web page containing
the
applet.
We have included a pair of <APPLET..> and </APPLET> tags in the HTML body section.
The
<APPLET...> tag supplies the name of the applet to be loaded and tells the browser how
much space
the applet requires. The <APPLET> tag given below specifies the minimum requirements
to place the
HelloJava applet on a web page. The display area for the applet output as 300 pixels width
and 200
pixels height. CENTER tags are used to display area in the center of the screen.
<APPLET CODE = hellojava.class WIDTH = 400 HEIGHT = 200 > </APPLET>
Example: Adding applet to HTML file:
Create Hellojava.html file with following code:
<HTML>
<! This page includes welcome title in the title bar and displays a welcome message. Then
it specifies
the applet to be loaded and executed.
<HEAD> <TITLE> Welcome to Java Applet </TITLE> </HEAD>
<BODY> <CENTER> <H1> Welcome to the world of Applets </H1> </CENTER> <BR>
<CENTER>
```

		<applet code="HelloJava.class" height="200" width="400"> </applet>	
	<b>e</b> )	Write a program to copy contents of one file to another.	4 M
	Ans	import java.io.*;	Correct
		class copyf	program- 4
		<b>\{</b>	M
		public static void main(String args[]) throws IOException	
		BufferedReader in=null;	
		BufferedWriter out=null;	
		try	
		{	
		in=new BufferedReader(new FileReader("input.txt"));	
		out=new BufferedWriter(new FileWriter("output.txt"));	
		int c;	
		while((c=in.read())!=-1)	
		{	
		out.write(c);	
		}	
		System.out.println("File copied successfully");	
		}	
		finally	
		{	
		if(in!=null)	
		in.close();	
		}	
		if(out!=null)	
		out.close();	
		}	
		}	
		}	
		}	
5.		Attempt any <u>TWO</u> of the following:	12 M
	a)	Compare array and vector. Explain elementAT() and addElement() methods.	6 M
	Ans		

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

Sr. No.	Array	Vector	
110.			
1	An array is a structure that holds multiple values of the same type.	The Vector is similar to array holds multiple objects and like an array; it contains components that can be accessed using an integer index.	
2	An array is a homogeneous data type where it can hold only objects of one data type.	Vectors are heterogeneous. You can have objects of different data types inside a Vector.	
3	After creation, an array is a fixed-length structure.	The size of a Vector can grow or shrink as needed to accommodate adding and removing items after the Vector has been created.	
4	Array can store primitive type data element.	Vector are store non-primitive type data element	
5	Array is unsynchronized i.e. automatically increase the size when the initialized size will be exceed.	Vector is synchronized i.e. when the size will be exceeding at the time; vector size will increase double of initial size.	
6	Declaration of an array:	Declaration of Vector:	
	int arr[] = new int [10];	Vector list = new Vector(3);	
7	Array is the static memory allocation.	. Vector is the dynamic memory allocation	
8	Array allocates the memory for the fixed size ,in array there is wastage of memory.	Vector allocates the memory dynamically means according to the requirement no wastage of memory.	
9	No methods are provided for adding and removing elements.	Vector provides methods for adding and removing elements.	
10	In array wrapper classes are not used.	Wrapper classes are used in vector	
11	Array is not a class.	Vector is a class.	

The elementAt() method of Java Vector class is used to get the element at the specified
